Figure 1: Predicted number of breast cancer cases detected and over-diagnosis per 100,000 women invited in each age group to screening (compared with the previous screening strategy).

Figure 2: Incremental life years, QALYs and costs per 100,000 women invited to screening (compared with the previous screening strategy).

Figure 3: Univariate Sensitivity Analysis: testing the robustness of basecase conclusion that screening up to age 78 most cost effective strategy.
