ABSTRACT
As HCI embraces experience design, it will increasingly rely on new elicitation methods that are capable of drawing out the multi-faceted subjectivities of individuals without being overly prescriptive as to the final design or experience outcome. In this panel we wish to describe and discuss subtle elicitation techniques that allow the elicitation of participant ideas and interests with minimum prejudicing by the researcher. We argue that leaving space for meaning to be made by project informants is a valuable approach to understanding both design requirements and use issues. We show work that has come from taking this approach and discuss why we have been concerned to keep a creative space open in our research and how we invite people into it.

1. INTRODUCTION
As HCI moves beyond a cognitive methodology and begins to embrace a broader context of everyday life and experience, new methods need to be developed which are able to draw out the multi-faceted subjectivities of individuals. Achieving this without influencing or leading participants is difficult however. In this panel we wish to explore how this might be possible and we present three projects that have made their mission the elicitation of participant ideas and interests with minimum prejudicing by the researcher. We argue that leaving space for meaning to be made by project informants is a valuable approach to understanding both design requirements and use issues. We will show work that has come from taking this approach and discuss why we have been concerned to keep a creative space open in our research and how we invite people into it.

2. THE BACKGROUND
Elicitation techniques have long sought to avoid ‘the leading question’ that will prejudice the informants in a study by giving them ideas or words to use in place of their own. Beyond the need for methodological rigour to ensure that findings are as asserted, researchers have looked for new and better ways to generate insights, using both quantitative and qualitative processes that leave space for ideas to appear from those being studied. In this way, social scientists have sought to engage participants on their own terms, even though the topic under review has been determined by the questioner.

Elicitation techniques have long sought to avoid ‘the leading question’ that will prejudice the informants in a study by giving them ideas or words to use in place of their own. Beyond the need for methodological rigour to ensure that findings are as asserted, researchers have looked for new and better ways to generate insights, using both quantitative and qualitative processes that leave space for ideas to appear from those being studied. In this way, social scientists have sought to engage participants on their own terms, even though the topic under review has been determined by the questioner.

One means of so engaging participants is to capture early design ideas in a form that can demonstrate a problem space without being unduly focused upon the technologies involved. Scenarios can do this by focusing upon the activities rather than the technologies that underpin interaction (eg [1]). Scenarios, then, communicate the essence of an interaction without specifying its form in any explicit detail. However we should note that, for many designers, this allusory nature of scenarios can be problematic. Using a more extreme technique, it is possible to eliminate the scenario and use other tools to elicit key concepts from potential users, leading to a purely person-centric view of particular phenomena (eg [2] on non-directive qualitative interviewing, or [3] on randomizing contexts).

In the HCI2006 workshop on “Designing the Not Quite Yet” [4], ‘scenarios’ were juxtaposed with ‘seeds’. Scenarios by their nature offer those that work with them a story to accept or
reject, develop or critique and this will determine the thinking that subsequently ensues. Seeds are smaller units of content, designed to allow thoughts to go in all directions (see fig 1). [5] talks of finding ‘as small a seed of content stimulus as possible that would ensure that some relevant creative work could be undertaken, but that the nature of it would be determined by the participant.’ Another approach comes from design, where absurdist cultural probes [6] such as dream recorders made space for people studied to bring in their own experience.

4.2 Light (chair)
Ann Light will be showing material devised as part of the “Democratising Technology” Designing for the 21st Century project, in which a performance artist, cognitive scientist, interaction design researcher and media arts strategist collaborated to create methods for engaging those excluded from digital design decisions and give them the will and the confidence to consider the forms of social relations that they would like ubiquitous digital networks to enable [5]. Working with material offered by participants to explore their interests and priorities, the team avoided suggesting what the future might look and feel like. The resulting workshop method is available on a DVD and here: http://www.thenotquiteyet.net.

4.3 Martin
Karen Martin was co-organiser, with Arianna Bassoli and Johanna Brewer, of a series of workshops on in-between-ness, in which researchers from industry and academia, architects, artists and social and computer scientists came together to explore the transitory nature of in-between spaces. These workshops served a dual purpose as an exploration of the topic of in-between-ness and of the nature of interdisciplinary collaboration [10]. Through observation, discussion and design activities the workshops offered participants the opportunity for immersive experience of, and reflection on, the workshop topic. From this a deeper understanding of the subject emerged organically as the workshop progressed. The workshops are documented on www.inbetweenness.org/.

5. THE SCHEDULE
We anticipate a section of show-and-tell from each panellist before a more general discussion of the ideas. And we will set a brief experiential exercise for the audience in keeping with the theme of the panel before opening the conversation to the floor.

6. ACKNOWLEDGMENTS
We thank the AHRC, EPSRC and ACE for their support of “Democratisising Technology” and all our co-designers.
