

Leading is a research centre comprised of a cross-disciplinary community of researchers in design, healthcare and cognitive practice. It is a research centre comprised of a cross-disciplinary community of researchers in design, healthcare and cognitive practice. Over the last 10 years the centre has undertaken ground-breaking research that has improved the quality of life for many people with dementia. Our engagement and collaboration take many forms and includes advising government, working with industry and contributing to ongoing academic discourse with the world.

Central to Lab4Living's approach are the methodological principles which engage with diverse communities of stakeholders from the outset of a research project. These focus on one of the many other conflicting voices engaged in the research.

We explore the challenges in the health care and explore the care relationship, challenges and opportunities presented by ageing in care, technology, wellbeing, safety, culture, and the economy. Mapping and engaging these domains to understand opportunities to change, improve, and establish new insights is a complex and iterative process but leads to our research and solutions that we believe will help and fix the important questions facing the response with dementia and solutions.

*Touch the illuminated circles to focus in on the research and push and pull the narrative.*
