Research question

To explore the perceptions of health care professionals regarding the management of multiple health conditions for patients over the age of 65 in the UK in primary care and the community setting.

Twenty Health care professionals were interviewed, using Constructive grounded theory based on Kathy Charmaz (2024) methodological approach. Semistructured interviews were conducted across Primary and Community Care

The aim of this poster is to showcase the key themes identified from the data analysis.

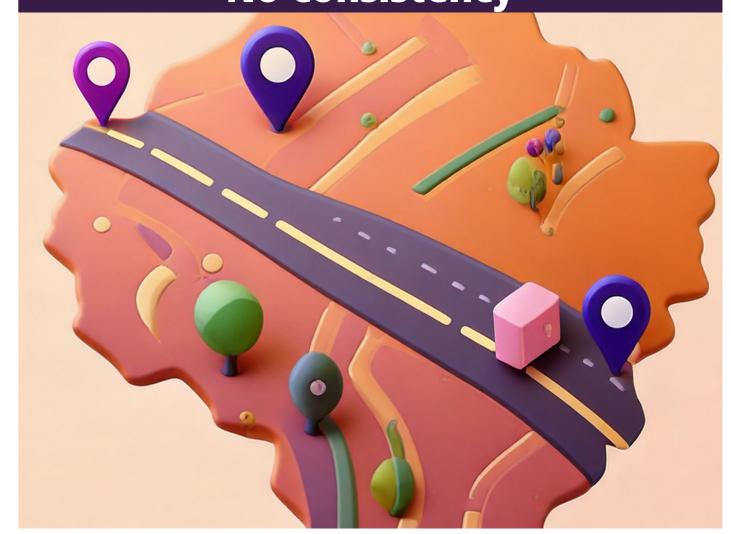

Specialist vs Generalist

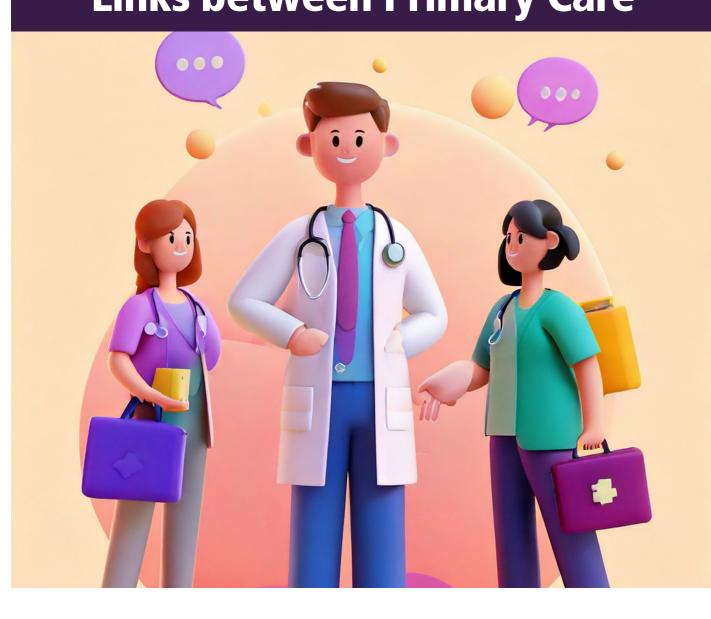

Lack of education

Geographical differences: No consistency

Links between Primary Care

Organisation of care

Importance of social prescribing

Multimorbidity can be characterised by reduction in mortality within the ageing population, the prevalence increase in older adults has been linked to medical advances, patient survival from once fatal medical conditions and an increase in the age of the population (Salive, 2012 and Formiga et al, 2013).

The Case Management Society of America (2022) defines case-management as "a collaborative process of assessment, planning, facilitation, care-coordination, evaluation and advocacy for options and services to meet an individual and family's comprehensive health needs through communication and available resources to promote quality, cost-effective, outcomes".
